```csharp
using System;

public partial class _Default : System.Web.UI.Page
{
    protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
    {

        //index 0 means orders
        if(DropDownList1.SelectedIndex==0)
        {
           //line below gets query run
           SqlDataSource1.SelectCommand = "select * from orders$";
            //line below makes connection between gridview and sqldatasource object
           GridView1.DataSource = SqlDataSource1;
           GridView1.AutoGenerateColumns = true;
           //binds everything together
            GridView1.DataBind();
        }
        else
        {
            //block below runs when index 1 is selected, which is customers table
            //line below gets query run
            SqlDataSource1.SelectCommand = "select * from customers$";
            //line below makes connection between gridview and sqldatasource object
            GridView1.DataSource = SqlDataSource1;
            GridView1.AutoGenerateColumns = true;
            //binds everything together
            GridView1.DataBind();
        }

    }
}
```
